

INTERNAL AUDIT

IA-2026-02 — Production and Support Processes

Risk-based internal audit covering document control, production, maintenance, competence, supplier quality, and corrective action.

Audit dates	23–24 June 2026
Lead auditor	Priya Shah, Internal Auditor (independent of audited work)
Areas sampled	M-14 production, final inspection, maintenance, training, supplier quality, CAPA
Result	2 internal nonconformities; 1 observation; 2 positive controls

Audit conclusion

The sampled processes were generally operating, but controls were not consistently demonstrated for released drawings and preventive-maintenance evidence. The audit also found that improvement actions are split across several trackers, reducing leadership visibility. No evidence of shipped nonconforming product was established from the sample; product-impact evaluation remains necessary.

Findings

ID / class	Evidence sampled	Requirement / expected state	Finding statement
IA-26-14 Internal NC	At machining center M-14, the start-up packet for lot L26-0619 contained HX-410 Drawing Rev B printed 21 June from the legacy shared drive. QMS Vault showed Rev C effective 10 June. No controlled-copy stamp or completed revision check was present.	NPS-PR-004 Rev C requires QMS Vault as the sole released source, obsolete copies removed within one business day, and start-of-shift revision verification.	Northstar did not ensure that the current released drawing was available and verified at point of use.
IA-26-15 Internal NC	PM work orders for HF-1500 (due 31 May) and HF-2600 (due 7 June) were not available in the CMMS or migration folder. Both assets were recorded as operating during June. Staff stated the work may have been completed, but no completion evidence or approved deferral was shown.	The maintenance program requires scheduled work to be completed, recorded, or formally deferred with risk evaluation.	Northstar could not demonstrate completion or controlled deferral of required preventive maintenance for two sampled assets.
IA-26-16 Observation	Audit, maintenance, supplier, and training actions were tracked in separate spreadsheets. Meeting notes referenced seven improvement items, but the auditor could not identify one complete register showing owner, date, risk, closure evidence, and effectiveness for all items.	Management expects material QMS actions to be visible and controlled through the CAPA process.	Consolidating improvement actions would reduce the risk of overdue or administratively closed work.

Sample details

Sample	Record / identifier	Result
Released drawing	HX-410 Rev C in QMS Vault, effective 10 Jun 2026	Current controlled revision confirmed
Point-of-use packet	Lot L26-0619, M-14, 21 Jun 2026	Rev B copy; no revision check
Preventive maintenance	HF-1500 WO-PM-260531; HF-2600 WO-PM-260607	No completion or deferral evidence
Calibration	Gauge GR-882, certificate CAL-26-188	Current through 18 Dec 2026; traceability recorded
Closed CAPA	CAPA C-021	Closure and 60-day effectiveness evidence present
Training	WI-410 Rev C training roll-up	Dashboard reported 98%; detail matrix not sampled during audit

Required response

- Contain immediate risk and evaluate affected product where applicable.
- Record root cause, corrective action, owner, due date, and objective closure evidence in the CAPA register.
- Verify effectiveness after implementation; administrative completion alone is not sufficient.
- Provide the response to the Internal Audit Lead by 15 July 2026.

Auditor note

This report records sampled evidence and does not itself establish product conformity, regulatory compliance, or certification status. Process owners remain responsible for evaluation and disposition.
