CC-2026-014 — Seal leakage after assembly

Customer complaint investigation record for HX-410 finished assemblies.

Customer	Titan Thermal Equipment
Received	22 June 2026
Product / lot	HX-410 / Northstar lot L26-0619
Quantity	6 units reported; 2 returned for evaluation
Status	Open — interim response sent 26 June 2026

Customer statement

Titan Thermal reported coolant leakage during end-of-line pressure testing. The customer observed incomplete gasket seating at one coolant port and requested containment, replacement units, and a cause-and-corrective-action response.

Northstar investigation

Evidence	Result
Returned unit examination	Both returned units showed a raised edge / burr witness at the coolant-port sealing surface.
Lot trace	Northstar lot L26-0619 used Apex Castings supplier lot AC-061426.
Production record	Machined at M-14 on 21 June 2026; in-process dimensions within recorded limits.
Final inspection	Visual and dimensional acceptance recorded. Final inspection used torque wrench TW-118 for fixture setup.
Drawing review	Investigator noted that the production packet contained HX-410 Rev B; impact of the Rev B / Rev C difference has not been documented.
Similar records	The complaint owner noted a possible similarity to recent incoming burr defects but did not record a SCAR or CAPA reference.

Containment and response

- Northstar placed remaining finished goods from lot L26-0619 on hold and initiated 100% visual inspection.
- Replacement units were shipped to Titan Thermal on 24 June 2026.
- The customer accepted the interim containment and requested the final corrective-action response by 29 July 2026.
- No documented decision has been made on whether the complaint, SCAR-2026-007, IA-26-14, or an internal CAPA should share one root-cause investigation.

Open questions

The evidence supports a plausible relationship among the customer complaint, the supplier burr condition, and the point-of-use drawing issue, but causation has not been established. A controlled investigation must distinguish contributing factors and document product impact.
